

**TRS2- Rock Dump Dispersal - Pipeline Excavation**  
Q3, 2020 - Sonar Grab showing 1.2m to TOP & TRS2 Deployment

Rotech Subsea were contracted by Boskalis to provide the TRS2 CFE tool for Pipeline de-burial and Rock dump dispersal. The scope of work consisted of dispersing 70m of rock reaching a depth of 1.2m. The rock dump material reached 12 inches in diameter.

The TRS2 was selected by Boskalis due to its high volume output performance making it the ideal tool for De-burial due to its ability to displace large amounts of subsea material. The Rotech Equipment was mobilised on the DSV Da Vinci and operated in water depths of approximately 43m.

The project was a success. The TRS2 displaced the rock dump with ease and efficiency with the whole excavation taking only 4 hours. This allowed Boskalis to recover the section of pipeline to deck in a timely and uncostly manner.
